

STOCKMAN

GRASS BLEND

Key Features

Stockman blend is a mixture designed to handle harsher conditions and withstand continuous grazing pressure. Stockman blend is a combination of long lasting perennial grass species and is fast to establish species to allow for grazing sooner.

Seeding Rate

- ▶ 20-30lbs/acre for straight seeding.
- ▶ 15-18 lbs/acre with 4-6 lbs/acre of a legume.
- ▶ 10-15lbs/acre for interseeding into existing grass and legume stands.

Seeding Depth

- ▶ ¼" into a firm, clod-free seedbed.
- ▶ ½" for no-tilling into existing pasture.

History and Development

Stockman is a blend of five different grass species to provide diversity for soils and conditions that require hardier species. In addition, both annual ryegrass and perennial ryegrass are included to establish fast to cover the soil and allow grazing to resume. Stockman will be best for the producer that set stocks or with pastures or soils that have tougher conditions.

Management Keys

Stockman blend is best suited for new pasture establishments and interseeding into existing pastures. This unique blend of grasses is well suited for the upper Midwest and under irrigation in the northern plains and intermountain west. Prairie Creek Seed recommends planting a legume blend in new establishments to support nitrogen production and the plant health of this mix. Annual ryegrass is a component of the blend that can be used as the nurse crop for establishment if desired.

Components	%
Tall Fescue	35
Orchardgrass	25
Perennial Ryegrass	20
Annual Ryegrass	15
Timothy	5
